

CSE 431/531: Algorithm Analysis and Design (Spring 2022)

Introduction and Syllabus

Lecturer: Shi Li

*Department of Computer Science and Engineering
University at Buffalo*

Outline

1 Syllabus

2 Introduction

- What is an Algorithm?
- Example: Insertion Sort
- Analysis of Insertion Sort

3 Asymptotic Notations

4 Common Running times

CSE 431/531: Algorithm Analysis and Design

- Course Webpage (contains schedule, policies, and slides):
<http://www.cse.buffalo.edu/~shil/courses/CSE531/>
- Please sign up course on Piazza via link on course webpage
 - homeworks, solutions, announcements, polls, asking/answering questions

CSE 431/531: Algorithm Analysis and Design

- Time & Location : 9:00am-9:50am, NSC 201
- Instructor:
 - Shi Li, shil@buffalo.edu
- TAs and Graders:
 - Sean Sanders, Xiaoyu Zhang,
 - Graders: TBD

You **should** already have/know:

- Mathematical Background
 - basic reasoning skills, inductive proofs
- Basic data Structures
 - linked lists, arrays
 - stacks, queues
- Some Programming Experience
 - Python, C, C++ or Java

You Will Learn

- Classic algorithms for classic problems
 - Sorting, shortest paths, minimum spanning tree, ...
- How to analyze algorithms
 - Correctness
 - Running time (efficiency)
- Meta techniques to design algorithms
 - Greedy algorithms
 - Divide and conquer
 - Dynamic programming
 - ...
- NP-completeness

Tentative Schedule

- 50 Minutes/Lecture \times 42 Lectures

Introduction	4 lectures
Graph Basics	3 lectures
Greedy Algorithms	7 lectures
Divide and Conquer	7 lectures
Dynamic Programming	7 lectures
Graph Algorithms	7 lectures
NP-Completeness	5 lectures
Final Review	2 lectures

Textbook

Textbook (Highly Recommended):

- Algorithm Design, 1st Edition, by
Jon Kleinberg and Eva Tardos

Other Reference Books

- Introduction to Algorithms, Third Edition, *Thomas Cormen, Charles Leiserson, Ronald Rivest, Clifford Stein*

Reading Before Classes

- Highly recommended: read the correspondent sections from the textbook (or reference book) before classes
 - Sections for each lecture can be found on the course webpage.
- Slides are posted on course webpage. They may get updated before the classes start.
- In last lecture of a major topic (Greedy Algorithms, Divide and Conquer, Dynamic Programming, Graph Algorithms), I will discuss exercise problems, which will be posted on the course webpage before class.

Grading

- 40% for theory homeworks
 - 8 points \times 5 theory homeworks
- 20% for programming problems
 - 10 points \times 2 programming assignments
- 40% for final exam

For Homeworks, You Are Allowed to

- Use course materials (textbook, reference books, lecture notes, etc)
- Post questions on Piazza
- Ask me or TAs for hints
- Collaborate with classmates
 - Think about each problem for enough time before discussions
 - **Must write down solutions on your own, in your own words**
 - Write down names of students you collaborated with

For Homeworks, You Are **Not** Allowed to

- Use external resources
 - Can't Google or ask questions online for solutions
 - Can't read posted solutions from other algorithm course webpages
- Copy solutions from other students

For Programming Problems

- Need to implement the algorithms by yourself
- Can not copy codes from others or the Internet
- We use Moss (<https://theory.stanford.edu/~aiken/moss/>) to detect similarity of programs

Late Policy

- You have 1 “late credit”, using it allows you to submit an assignment solution for three days
- With no special reasons, no other late submissions will be accepted

- Final Exam will be closed-book

Academic Integrity (AI) Policy for the Course

- minor violation:
 - 0 score for the involved homework/prog. assignment, and
 - 1-letter grade down
- 2 minor violations = 1 major violation
 - failure for the course
 - case will be reported to the department and university
 - further sanctions may include a dishonesty mark on transcript or expulsion from university

Questions?

Outline

- 1 Syllabus
- 2 Introduction
 - What is an Algorithm?
 - Example: Insertion Sort
 - Analysis of Insertion Sort
- 3 Asymptotic Notations
- 4 Common Running times

Outline

- 1 Syllabus
- 2 Introduction
 - What is an Algorithm?
 - Example: Insertion Sort
 - Analysis of Insertion Sort
- 3 Asymptotic Notations
- 4 Common Running times

What is an Algorithm?

- Donald Knuth: An algorithm is a finite, definite effective procedure, with some input and some output.
- Computational problem: specifies the input/output relationship.
- An algorithm **solves** a computational problem if it produces the correct output for any given input.

Examples

Greatest Common Divisor

Input: two integers $a, b > 0$

Output: the greatest common divisor of a and b

Example:

- Input: 210, 270
- Output: 30
- Algorithm: Euclidean algorithm
- $\gcd(270, 210) = \gcd(210, 270 \bmod 210) = \gcd(210, 60)$
- $(270, 210) \rightarrow (210, 60) \rightarrow (60, 30) \rightarrow (30, 0)$

Examples

Sorting

Input: sequence of n numbers (a_1, a_2, \dots, a_n)

Output: a permutation $(a'_1, a'_2, \dots, a'_n)$ of the input sequence such that $a'_1 \leq a'_2 \leq \dots \leq a'_n$

Example:

- Input: 53, 12, 35, 21, 59, 15
- Output: 12, 15, 21, 35, 53, 59
- Algorithms: insertion sort, merge sort, quicksort, ...

Examples

Shortest Path

Input: directed graph $G = (V, E)$, $s, t \in V$

Output: a shortest path from s to t in G

- Algorithm: Dijkstra's algorithm

Algorithm = Computer Program?

- Algorithm: “abstract”, can be specified using computer program, English, pseudo-codes or flow charts.
- Computer program: “concrete”, implementation of algorithm, using a particular programming language

Pseudo-Code

Pseudo-Code:

Euclidean(a, b)

```
1: while  $b > 0$  do  
2:    $(a, b) \leftarrow (b, a \bmod b)$   
3: return  $a$ 
```

C++ program:

```
• int Euclidean(int a, int b){  
•   int c;  
•   while (b > 0){  
•       c = b;  
•       b = a % b;  
•       a = c;  
•   }  
•   return a;  
• }
```

Theoretical Analysis of Algorithms

- Main focus: correctness, running time (efficiency)
- Sometimes: memory usage
- Not covered in the course: engineering side
 - extensibility
 - modularity
 - object-oriented model
 - user-friendliness (e.g, GUI)
 - ...
- Why is it important to study the running time (efficiency) of an algorithm?
 - 1 feasible vs. infeasible
 - 2 efficient algorithms: less engineering tricks needed, can use languages aiming for easy programming (e.g, python)
 - 3 fundamental
 - 4 it is fun!

Outline

- 1 Syllabus
- 2 Introduction
 - What is an Algorithm?
 - Example: Insertion Sort
 - Analysis of Insertion Sort
- 3 Asymptotic Notations
- 4 Common Running times

Sorting Problem

Input: sequence of n numbers (a_1, a_2, \dots, a_n)

Output: a permutation $(a'_1, a'_2, \dots, a'_n)$ of the input sequence such that $a'_1 \leq a'_2 \leq \dots \leq a'_n$

Example:

- Input: 53, 12, 35, 21, 59, 15
- Output: 12, 15, 21, 35, 53, 59

Insertion-Sort

- At the end of j -th iteration, the first j numbers are sorted.

iteration 1: 53, 12, 35, 21, 59, 15

iteration 2: 12, 53, 35, 21, 59, 15

iteration 3: 12, 35, 53, 21, 59, 15

iteration 4: 12, 21, 35, 53, 59, 15

iteration 5: 12, 21, 35, 53, 59, 15

iteration 6: 12, 15, 21, 35, 53, 59

Example:

- Input: 53, 12, 35, 21, 59, 15
- Output: 12, 15, 21, 35, 53, 59

insertion-sort(A, n)

```
1: for  $j \leftarrow 2$  to  $n$  do  
2:    $key \leftarrow A[j]$   
3:    $i \leftarrow j - 1$   
4:   while  $i > 0$  and  $A[i] > key$  do  
5:      $A[i + 1] \leftarrow A[i]$   
6:      $i \leftarrow i - 1$   
7:    $A[i + 1] \leftarrow key$ 
```

- $j = 6$
- $key = 15$

 i

Outline

- 1 Syllabus
- 2 Introduction
 - What is an Algorithm?
 - Example: Insertion Sort
 - Analysis of Insertion Sort
- 3 Asymptotic Notations
- 4 Common Running times

Analysis of Insertion Sort

- Correctness
- Running time

Correctness of Insertion Sort

- Invariant: after iteration j of outer loop, $A[1..j]$ is the sorted array for the original $A[1..j]$.

after $j = 1$: 53, 12, 35, 21, 59, 15

after $j = 2$: 12, 53, 35, 21, 59, 15

after $j = 3$: 12, 35, 53, 21, 59, 15

after $j = 4$: 12, 21, 35, 53, 59, 15

after $j = 5$: 12, 21, 35, 53, 59, 15

after $j = 6$: 12, 15, 21, 35, 53, 59

Analyzing Running Time of Insertion Sort

- Q1: what is the size of input?
- A1: Running time as the function of **size**
- possible definition of size :
 - Sorting problem: # integers,
 - Greatest common divisor: total length of two integers
 - Shortest path in a graph: # edges in graph
- Q2: Which input?
 - For the insertion sort algorithm: if input array is already sorted in ascending order, then algorithm runs much faster than when it is sorted in descending order.
- A2: Worst-case analysis:
 - Running time for size n = worst running time over all possible arrays of length n

Analyzing Running Time of Insertion Sort

- Q3: How fast is the computer?
- Q4: Programming language?
- A: They do not matter!

Important idea: asymptotic analysis

- Focus on growth of running-time as a function, not any particular value.

Asymptotic Analysis: O -notation

Informal way to define O -notation:

- Ignoring lower order terms
- Ignoring leading constant
- $3n^3 + 2n^2 - 18n + 1028 \Rightarrow 3n^3 \Rightarrow n^3$
- $3n^3 + 2n^2 - 18n + 1028 = O(n^3)$
- $n^2/100 - 3n + 10 \Rightarrow n^2/100 \Rightarrow n^2$
- $n^2/100 - 3n + 10 = O(n^2)$

Asymptotic Analysis: O -notation

- $3n^3 + 2n^2 - 18n + 1028 = O(n^3)$
- $n^2/100 - 3n^2 + 10 = O(n^2)$

O -notation allows us to ignore

- architecture of computer
- programming language
- how we measure the running time: seconds or # instructions?
- to execute $a \leftarrow b + c$:
 - program 1 requires 10 instructions, or 10^{-8} seconds
 - program 2 requires 2 instructions, or 10^{-9} seconds
 - they only change by a constant in the running time, which will be hidden by the $O(\cdot)$ notation

Asymptotic Analysis: O -notation

- Algorithm 1 runs in time $O(n^2)$
- Algorithm 2 runs in time $O(n)$
- Does not tell which algorithm is faster for a specific n !
- Algorithm 2 will eventually beat algorithm 1 as n increases.
- For Algorithm 1: if we increase n by a factor of 2, running time increases by a factor of 4
- For Algorithm 2: if we increase n by a factor of 2, running time increases by a factor of 2

Asymptotic Analysis of Insertion Sort

insertion-sort(A, n)

```
1: for  $j \leftarrow 2$  to  $n$  do  
2:    $key \leftarrow A[j]$   
3:    $i \leftarrow j - 1$   
4:   while  $i > 0$  and  $A[i] > key$  do  
5:      $A[i + 1] \leftarrow A[i]$   
6:      $i \leftarrow i - 1$   
7:    $A[i + 1] \leftarrow key$ 
```

- Worst-case running time for iteration j of the outer loop?

Answer: $O(j)$

- Total running time = $\sum_{j=2}^n O(j) = O(\sum_{j=2}^n j)$
 $= O(\frac{n(n+1)}{2} - 1) = O(n^2)$

Computation Model

- Random-Access Machine (RAM) model
 - reading and writing $A[j]$ takes $O(1)$ time
- Basic operations such as addition, subtraction and multiplication take $O(1)$ time
- Each integer (word) has $c \log n$ bits, $c \geq 1$ large enough
 - Reason: often we need to read the integer n and handle integers within range $[-n^c, n^c]$, it is convenient to assume this takes $O(1)$ time.
- What is the precision of real numbers?
Most of the time, we only consider integers.
- Can we do better than insertion sort asymptotically?
- Yes: merge sort, quicksort and heap sort take $O(n \log n)$ time

- Remember to sign up for Piazza.

Questions?

Outline

- 1 Syllabus
- 2 Introduction
 - What is an Algorithm?
 - Example: Insertion Sort
 - Analysis of Insertion Sort
- 3 Asymptotic Notations**
- 4 Common Running times

Asymptotically Positive Functions

Def. $f : \mathbb{N} \rightarrow \mathbb{R}$ is an **asymptotically positive function** if:

- $\exists n_0 > 0$ such that $\forall n > n_0$ we have $f(n) > 0$
- In other words, $f(n)$ is positive for large enough n .
- $n^2 - n - 30$ **Yes**
- $2^n - n^{20}$ **Yes**
- $100n - n^2/10 + 50?$ **No**
- We only consider asymptotically positive functions.

O-Notation: Asymptotic Upper Bound

O-Notation For a function $g(n)$,

$$O(g(n)) = \{ \text{function } f : \exists c > 0, n_0 > 0 \text{ such that} \\ f(n) \leq cg(n), \forall n \geq n_0 \}.$$

- In other words, $f(n) \in O(g(n))$ if $f(n) \leq cg(n)$ for **some** $c > 0$ and **every** large enough n .

O-Notation: Asymptotic Upper Bound

O-Notation For a function $g(n)$,

$$O(g(n)) = \{\text{function } f : \exists c > 0, n_0 > 0 \text{ such that} \\ f(n) \leq cg(n), \forall n \geq n_0\}.$$

- In other words, $f(n) \in O(g(n))$ if $f(n) \leq cg(n)$ for **some** $c > 0$ and **every** large enough n .
- $3n^2 + 2n \in O(n^2 - 10n)$

Proof.

Let $c = 4$ and $n_0 = 50$, for every $n > n_0 = 50$, we have,

$$\begin{aligned} 3n^2 + 2n - c(n^2 - 10n) &= 3n^2 + 2n - 4(n^2 - 10n) \\ &= -n^2 + 40n \leq 0. \end{aligned}$$

$$3n^2 + 2n \leq c(n^2 - 10n)$$

O -Notation For a function $g(n)$,

$$O(g(n)) = \left\{ \text{function } f : \exists c > 0, n_0 > 0 \text{ such that} \right. \\ \left. f(n) \leq cg(n), \forall n \geq n_0 \right\}.$$

- In other words, $f(n) \in O(g(n))$ if $f(n) \leq cg(n)$ for some c and large enough n .
- $3n^2 + 2n \in O(n^2 - 10n)$
- $3n^2 + 2n \in O(n^3 - 5n^2)$
- $n^{100} \in O(2^n)$
- $n^3 \notin O(10n^2)$

Asymptotic Notations	O	Ω	Θ
Comparison Relations	\leq		

Conventions

- We use “ $f(n) = O(g(n))$ ” to denote “ $f(n) \in O(g(n))$ ”
- $3n^2 + 2n = O(n^3 - 10n)$
- $3n^2 + 2n = O(n^2 + 5n)$
- $3n^2 + 2n = O(n^2)$

“=” is asymmetric! Following equalities are wrong:

- $O(n^3 - 10n) = 3n^2 + 2n$
- $O(n^2 + 5n) = 3n^2 + 2n$
- $O(n^2) = 3n^2 + 2n$
- Analogy: Mike is a student. ~~A student is Mike.~~

Ω -Notation: Asymptotic Lower Bound

O -Notation For a function $g(n)$,

$$O(g(n)) = \{\text{function } f : \exists c > 0, n_0 > 0 \text{ such that} \\ f(n) \leq cg(n), \forall n \geq n_0\}.$$

Ω -Notation For a function $g(n)$,

$$\Omega(g(n)) = \{\text{function } f : \exists c > 0, n_0 > 0 \text{ such that} \\ f(n) \geq cg(n), \forall n \geq n_0\}.$$

- In other words, $f(n) \in \Omega(g(n))$ if $f(n) \geq cg(n)$ for some c and large enough n .

Ω -Notation: Asymptotic Lower Bound

Ω -Notation For a function $g(n)$,

$$\Omega(g(n)) = \{ \text{function } f : \exists c > 0, n_0 > 0 \text{ such that} \\ f(n) \geq cg(n), \forall n \geq n_0 \}.$$

Ω -Notation: Asymptotic Lower Bound

- Again, we use “=” instead of \in .
- $4n^2 = \Omega(n - 10)$
- $3n^2 - n + 10 = \Omega(n^2 - 20)$

Asymptotic Notations	O	Ω	Θ
Comparison Relations	\leq	\geq	

Theorem $f(n) = O(g(n)) \Leftrightarrow g(n) = \Omega(f(n)).$

Θ -Notation: Asymptotic Tight Bound

Θ -Notation For a function $g(n)$,

$$\Theta(g(n)) = \left\{ \text{function } f : \exists c_2 \geq c_1 > 0, n_0 > 0 \text{ such that} \right. \\ \left. c_1 g(n) \leq f(n) \leq c_2 g(n), \forall n \geq n_0 \right\}.$$

- $f(n) = \Theta(g(n))$, then for large enough n , we have “ $f(n) \approx g(n)$ ”.

Θ -Notation: Asymptotic Tight Bound

Θ -Notation For a function $g(n)$,

$$\Theta(g(n)) = \left\{ \text{function } f : \exists c_2 \geq c_1 > 0, n_0 > 0 \text{ such that} \right. \\ \left. c_1 g(n) \leq f(n) \leq c_2 g(n), \forall n \geq n_0 \right\}.$$

- $3n^2 + 2n = \Theta(n^2 - 20n)$
- $2^{n/3+100} = \Theta(2^{n/3})$

Asymptotic Notations	O	Ω	Θ
Comparison Relations	\leq	\geq	$=$

Theorem $f(n) = \Theta(g(n))$ if and only if
 $f(n) = O(g(n))$ and $f(n) = \Omega(g(n))$.

Asymptotic Notations	O	Ω	Θ
Comparison Relations	\leq	\geq	$=$

Trivial Facts on Comparison Relations

- $a \leq b \Leftrightarrow b \geq a$
- $a = b \Leftrightarrow a \leq b \text{ and } a \geq b$
- $a \leq b \text{ or } a \geq b$

Correct Analogies

- $f(n) = O(g(n)) \Leftrightarrow g(n) = \Omega(f(n))$
- $f(n) = \Theta(g(n)) \Leftrightarrow f(n) = O(g(n)) \text{ and } f(n) = \Omega(g(n))$

Incorrect Analogy

- $f(n) = O(g(n)) \text{ or } f(n) = \Omega(g(n))$

Incorrect Analogy

- $f(n) = O(g(n))$ or $f(n) = \Omega(g(n))$

$$f(n) = n^2$$

$$g(n) = \begin{cases} 1 & \text{if } n \text{ is odd} \\ n^3 & \text{if } n \text{ is even} \end{cases}$$

Recall: Informal way to define O -notation

- ignoring lower order terms: $3n^2 - 10n - 5 \rightarrow 3n^2$
- ignoring leading constant: $3n^2 \rightarrow n^2$
- $3n^2 - 10n - 5 = O(n^2)$
- Indeed, $3n^2 - 10n - 5 = \Omega(n^2), 3n^2 - 10n - 5 = \Theta(n^2)$
- In the formal definition of $O(\cdot)$, nothing tells us to ignore lower order terms and leading constant.
- $3n^2 - 10n - 5 = O(5n^2 - 6n + 5)$ is correct, though weird
- $3n^2 - 10n - 5 = O(n^2)$ is the most natural since n^2 is the simplest term we can have inside $O(\cdot)$.

Notice that O denotes asymptotic **upper** bound

- $n^2 + 2n = O(n^3)$ is correct.
- The following sentence is correct: the running time of the insertion sort algorithm is $O(n^4)$.
- We say: the running time of the insertion sort algorithm is $O(n^2)$ and **the bound is tight**.
- We do not use Ω and Θ very often when we upper bound running times.

Exercise

For each pair of functions f, g in the following table, indicate whether f is O , Ω or Θ of g .

f	g	O	Ω	Θ
$n^3 - 100n$	$5n^2 + 3n$	No	Yes	No
$3n - 50$	$n^2 - 7n$	Yes	No	No
$n^2 - 100n$	$5n^2 + 30n$	Yes	Yes	Yes
$\log_2 n$	$\log_{10} n$	Yes	Yes	Yes
$\log^{10} n$	$n^{0.1}$	Yes	No	No
2^n	$2^{n/2}$	No	Yes	No
\sqrt{n}	$n^{\sin n}$	No	No	No

We often use $\log n$ for $\log_2 n$. But for $O(\log n)$, the base is not important.

Asymptotic Notations	O	Ω	Θ	o	ω
Comparison Relations	\leq	\geq	$=$	$<$	$>$

Questions?

Outline

- 1 Syllabus
- 2 Introduction
 - What is an Algorithm?
 - Example: Insertion Sort
 - Analysis of Insertion Sort
- 3 Asymptotic Notations
- 4 Common Running times

$O(n)$ (Linear) Running Time

Computing the sum of n numbers

sum(A, n)

```
1:  $S \leftarrow 0$   
2: for  $i \leftarrow 1$  to  $n$   
3:    $S \leftarrow S + A[i]$   
4: return  $S$ 
```

$O(n)$ (Linear) Running Time

- Merge two sorted arrays

$O(n)$ (Linear) Running Time

$\text{merge}(B, C, n_1, n_2)$ $\backslash \backslash$ B and C are sorted, with
length n_1 and n_2

```
1:  $A \leftarrow []$ ;  $i \leftarrow 1$ ;  $j \leftarrow 1$ 
2: while  $i \leq n_1$  and  $j \leq n_2$  do
3:   if  $B[i] \leq C[j]$  then
4:     append  $B[i]$  to  $A$ ;  $i \leftarrow i + 1$ 
5:   else
6:     append  $C[j]$  to  $A$ ;  $j \leftarrow j + 1$ 
7: if  $i \leq n_1$  then append  $B[i..n_1]$  to  $A$ 
8: if  $j \leq n_2$  then append  $C[j..n_2]$  to  $A$ 
9: return  $A$ 
```

Running time = $O(n)$ where $n = n_1 + n_2$.

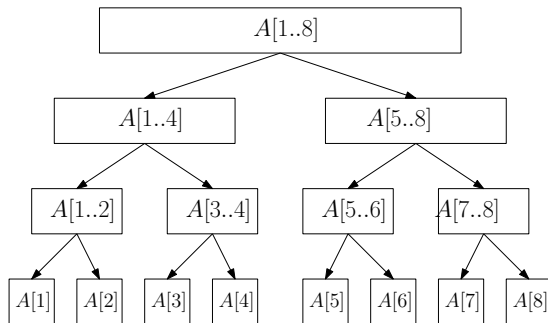

$O(n \log n)$ Running Time

merge-sort(A, n)

```
1: if  $n = 1$  then  
2:   return  $A$   
3: else  
4:    $B \leftarrow \text{merge-sort}(A[1..\lfloor n/2 \rfloor], \lfloor n/2 \rfloor)$   
5:    $C \leftarrow \text{merge-sort}(A[\lfloor n/2 \rfloor + 1..n], n - \lfloor n/2 \rfloor)$   
6: return  $\text{merge}(B, C, \lfloor n/2 \rfloor, n - \lfloor n/2 \rfloor)$ 
```

$O(n \log n)$ Running Time

- Merge-Sort

- Each level takes running time $O(n)$
- There are $O(\log n)$ levels
- Running time = $O(n \log n)$

$O(n^2)$ (Quadratic) Running Time

Closest Pair

Input: n points in plane: $(x_1, y_1), (x_2, y_2), \dots, (x_n, y_n)$

Output: the pair of points that are closest

$O(n^2)$ (Quadratic) Running Time

Closest Pair

Input: n points in plane: $(x_1, y_1), (x_2, y_2), \dots, (x_n, y_n)$

Output: the pair of points that are closest

closest-pair(x, y, n)

```
1:  $bestd \leftarrow \infty$ 
2: for  $i \leftarrow 1$  to  $n - 1$  do
3:   for  $j \leftarrow i + 1$  to  $n$  do
4:      $d \leftarrow \sqrt{(x[i] - x[j])^2 + (y[i] - y[j])^2}$ 
5:     if  $d < bestd$  then
6:        $besti \leftarrow i, bestj \leftarrow j, bestd \leftarrow d$ 
7: return ( $besti, bestj$ )
```

Closest pair can be solved in $O(n \log n)$ time!

$O(n^3)$ (Cubic) Running Time

Multiply two matrices of size $n \times n$

matrix-multiplication(A, B, n)

```
1:  $C \leftarrow$  matrix of size  $n \times n$ , with all entries being 0
2: for  $i \leftarrow 1$  to  $n$  do
3:   for  $j \leftarrow 1$  to  $n$  do
4:     for  $k \leftarrow 1$  to  $n$  do
5:        $C[i, k] \leftarrow C[i, k] + A[i, j] \times B[j, k]$ 
6: return  $C$ 
```

Beyond Polynomial Time: 2^n

Maximum Independent Set Problem

Input: graph $G = (V, E)$

Output: the maximum independent set of G

max-independent-set($G = (V, E)$)

```
1:  $R \leftarrow \emptyset$ 
2: for every set  $S \subseteq V$  do
3:    $b \leftarrow \text{true}$ 
4:   for every  $u, v \in S$  do
5:     if  $(u, v) \in E$  then  $b \leftarrow \text{false}$ 
6:   if  $b$  and  $|S| > |R|$  then  $R \leftarrow S$ 
7: return  $R$ 
```

Running time = $O(2^n n^2)$.

Beyond Polynomial Time: $n!$

Hamiltonian Cycle Problem

Input: a graph with n vertices

Output: a cycle that visits each node exactly once,
or say no such cycle exists

Beyond Polynomial Time: $n!$

Hamiltonian($G = (V, E)$)

```
1: for every permutation  $(p_1, p_2, \dots, p_n)$  of  $V$  do  
2:    $b \leftarrow \text{true}$   
3:   for  $i \leftarrow 1$  to  $n - 1$  do  
4:     if  $(p_i, p_{i+1}) \notin E$  then  $b \leftarrow \text{false}$   
5:   if  $(p_n, p_1) \notin E$  then  $b \leftarrow \text{false}$   
6:   if  $b$  then return  $(p_1, p_2, \dots, p_n)$   
7: return "No Hamiltonian Cycle"
```

Running time = $O(\textcolor{red}{n!} \times n)$

$O(\log n)$ (Logarithmic) Running Time

- Binary search
 - Input: sorted array A of size n , an integer t ;
 - Output: whether t appears in A .
- E.g, search 35 in the following array:

3	8	10	25	29	37	38	42	46	52	59	61	63	75	79
---	---	----	----	----	----	----	----	----	----	----	----	----	----	----

$O(\log n)$ (Logarithmic) Running Time

Binary search

- Input: sorted array A of size n , an integer t ;
- Output: whether t appears in A .

binary-search(A, n, t)

```
1:  $i \leftarrow 1, j \leftarrow n$ 
2: while  $i \leq j$  do
3:    $k \leftarrow \lfloor (i + j)/2 \rfloor$ 
4:   if  $A[k] = t$  return true
5:   if  $t < A[k]$  then  $j \leftarrow k - 1$  else  $i \leftarrow k + 1$ 
6: return false
```

Running time = $O(\log n)$

Comparing the Orders

- Sort the functions from smallest to largest asymptotically
 $\log n, n, n^2, n \log n, n!, 2^n, e^n, n^n$
- $\log n = O(n)$
- $n = O(n^2)$
 $n = O(n \log n)$
- $n \log n = O(n^2)$
- $n^2 = O(n!)$
 $n^2 = O(2^n)$
- $2^n = O(n!)$
 $2^n = O(e^n)$
- $e^n = O(n!)$
- $n! = O(n^n)$

Terminologies

When we talk about upper bound on running time:

- Logarithmic time: $O(\log n)$
- Linear time: $O(n)$
- Quadratic time $O(n^2)$
- Cubic time $O(n^3)$
- Polynomial time: $O(n^k)$ for some constant k
 - $O(n \log n) \subseteq O(n^{1.1})$. So, an $O(n \log n)$ -time algorithm is also a polynomial time algorithm.
- Exponential time: $O(c^n)$ for some $c > 1$
- Sub-linear time: $o(n)$
- Sub-quadratic time: $o(n^2)$

Goal of Algorithm Design

- Design algorithms to minimize the order of the running time.
- Using asymptotic analysis allows us to ignore the leading constants and lower order terms
- Makes our life much easier! (E.g., the leading constant depends on the implementation, compiler and computer architecture of computer.)

Q: Does ignoring the leading constant cause any issues?

- e.g, how can we compare an algorithm with running time $0.1n^2$ with an algorithm with running time $1000n$?

A:

- Sometimes yes
- However, when n is big enough, $1000n < 0.1n^2$
- For “natural” algorithms, constants are not so big!
- So, for reasonably large n , algorithm with lower order running time beats algorithm with higher order running time.
